# Introduction

Innovation is the key to bringing efficiency to and boosting productivity in an organization. Routine and mundane tasks are slowly being taken over by automation across different industries. Automation has the ability not only to speed up the processes but also can increase accuracy which in turn reduces human errors. Straight Through Processing is one such addition to documenting automation processes that can help in boosting operational efficiency in an organization.

When it comes to processing invoices, receipts, purchase orders and so on, an organization has to deal with tons of paperwork. Apart from that, human intervention is a must at all stages. This can create certain delays in processing critical documents and leading to backlogs and delays in the production & distribution of goods and services. It is estimated that employees spent up to **40% of their time only searching documents manually.** Combining the strengths of advanced OCR technology and Straight Through Processing, such delays can be reduced drastically.

# Understanding Straight through processing

**Straight Through Processing (STP)** is a process that makes document processing completely automated and requires almost zero human intervention. From the very beginning till the end, any type of documents, be it invoices, receipts, purchase orders, identification documents, all of them are processed without any manual inputs.

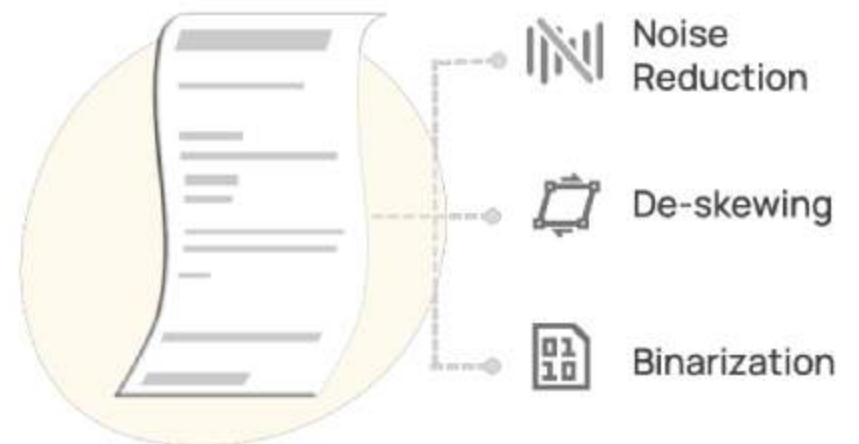

STP is a part of **Intelligent Document Processing (IDP)** and using self-learning Artificial Intelligence technology, the entire process can be upgraded automatically. Unstructured and unorganized documents can also be processed through STP.

## Stages of Automated Document Processing

## 1. Pre-processing & Auto-rejection

The first stage filters out the documents that cannot be processed due to their sub-standard image quality. Documents from different devices are collated here. These documents can be electronic such as e-mails or PDFs or can be handwritten or scanned images of printed files. Documents that the system identifies as sub-par quality are rejected automatically. Documents can be rejected due to their faded print, zoomed out images, an overlap of text among various other reasons. The documents that are detected and can be processed are sent through for the document classification stage.

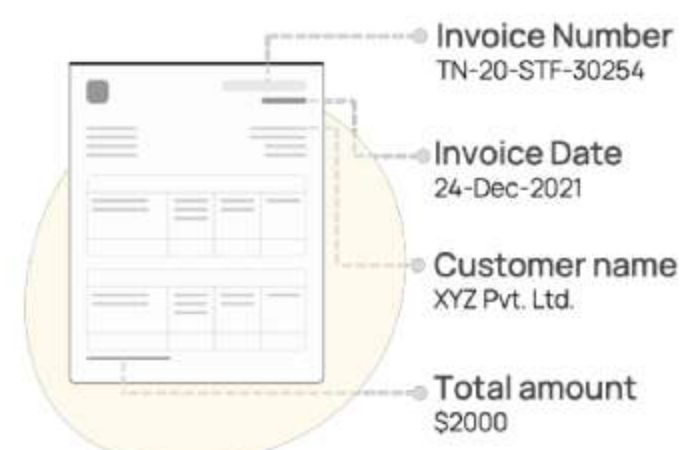

## 2. Document Classification

At times, documents may contain multiple pages in one document that are not related to one another. For example, purchase order and an invoice might have been scanned or merged while sending it via email. The technology can identify whether this document is an invoice, a receipt, a purchase order and separate them accordingly. Unstructured data can also be processed through the KlearStack AI technology.

## 3. Data Extraction

The data from the document is extracted at this stage. Fields like document number, description details, amount, quantity, date etc. are extracted. This stage is the most crucial of the entire process as STP is highly dependent on the accuracy of data that is being extracted.

## 4. Post-Processing

Once the data is extracted, the data is formatted and standardized. Some documents may have dates written in 01-JAN-2022 and some documents may have dates formatted in 01-01-22. In the post-processing stage, data from all fields are formatted so that when the data is processed further, it is structured uniformly.

## 5. Data Validation

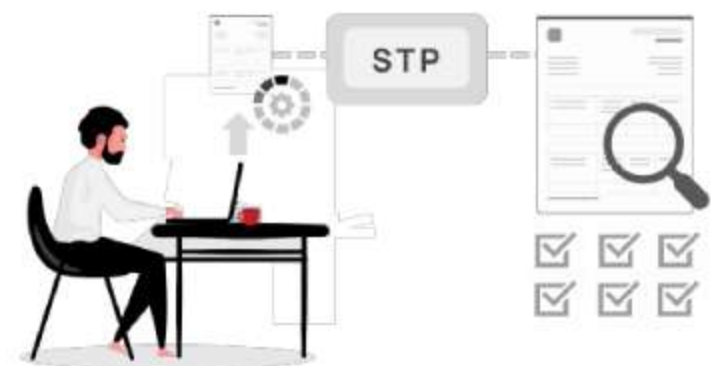

This is the last stage before STP. Organizations can create custom data validations wherein the documents that match the data validation criteria are processed. Say for example the organization wants to process documents that have purchase orders between USD 100,000 and USD 1,000,000, it can be done so and only those documents that match these criteria are processed. Different sets of user-defined criteria can be set by the organization for data validation.

## 6. Straight-through-processing

With the help of software integrations such as SAP or QuickBooks, Straight Through Processing is accomplished. Data from documents that have met the validation criteria will now be directly transferred to the integrated software. Data that did not match the data validation criteria will be pushed to the exception queue.

Only at this stage, human intervention is required for the data that did not go through any of the above layers. The AI technology comes with self-learning capabilities and therefore through identifying such errors, the system learns and improves the document processing accuracy.

# STP Automation Process

STP document processing has **five crucial steps** involved. We will deep dive into each step to understand how exactly the entire process is executed without any human intervention.

## 1. Data capture Accuracy

The first step once the documents are uploaded is to identify how accurately the data has been captured. Advanced OCR along with context-based AI technology will detect, automatically extract and capture the fields. Invoice numbers, billing amount, date, invoice total, supplier name, customer name, currency, line-item description, line-item quantity, line-item rate, line-item code, line item total etc are some of the many fields that will be captured automatically.

Once the data is captured, it can be manually checked whether the right information has been extracted for the right field. In case it has not, it can be amended and next time a similar document is uploaded, the self-learning AI technology will recognize it and capture the data accordingly.

## 2. Confidence Score

After the data is captured by the system, a confidence score is generated. In very simple terms, the confidence score is a metric to understand the probability of accuracy of information from the documents. The confidence score is based on the fields that have captured data, the quality of the documents scanned and so on.

KlearStack AI calculates the confidence score per field and the overall confidence score for the document. KlearStack AI recommends keeping the minimum confidence score threshold at 85% or higher to extract and process documents as accurately as possible. However, organizations can amend the confidence score threshold as per their process tolerance. This option is given to the KlearStack users as each organization has unique processes to handle invoices, receipts and such documents.

So if the organization has set the confidence score to 70% and the document uploaded shows a confidence score of 65, KlearStack STP will flag it as an exception and stop the document automation process. If the confidence score of a document uploaded is 75, documents will proceed to the next stage of STP – Data Validation.

### 3. Data Validation

At this stage, customizable data validation rules set by the organization are matched with the documents uploaded. There is no limit as to how many data validation criteria can be set by the organization. This stage helps to filter out documents that should proceed with the next steps of STP.

Say the organization wants to have at least 1 manual review and approval step for invoices above USD 50,000 value. If this data validation rule is set by the organization, invoices that have a total billing amount above USD 50,000, will be sent to the next stage. If the value of an invoice is less than USD 50,000, KlearStack STP will not allow the documents to proceed to the next stage.

### 4. Data Reconciliation

This is the second last stage in the STP automation process. Users can set cross-document type reconciliation rules for checking data integrity across multiple data sources. For example, the PO reference number from a newly processed invoice can be cross-checked with the PO number from the corresponding purchase order. This process is very important because it validates if the transaction matches with a previously processed document of the same number or not, that had the same item descriptions, quantity of goods and total billing amount.

Let us say the customer raised a purchase order with the number PO1234 towards a supplier. Once the order is fulfilled, the supplier will share the invoice with the customer with the same purchase order number, PO1234. The system at this stage will reconcile these documents. It will match the purchase order of the supplier and invoice of the manufacturer to ensure that documents of the same transaction are being processed.

### 5. Data Transformation

This is the final stage of the STP document automation process. The original predicted data from the documents is transformed and converted as per the user's needs. If for example the supplier is using alphanumeric for their stock inventory identification codes, and the customer is using alphanumeric codes, the documents will match and transform codes as per the suppliers' numeric codes and customer's alphanumeric code format.

With this, the STP document process is over, and the extracted data will be archived on the QuickBooks or SAP-integrated software. If KlearStack API is used, the data can be then stored with any integration.

## Benefits of STP

### No Human Intervention

STP is a 100% automated process for digitizing, capturing data from and archiving documents. There is no requirement for any manual intervention throughout the process. By removing manual intervention, allocation of human resources can be made more wisely. Critical thinking and creativity are where the human capital can shine on and leave the mundane tasks of data entry to technology.

### Market Flexibility

Market conditions are quite dynamic in nature. Not two quarters in a financial year will provide the same results. At the peak business quarter, it may get difficult to process tons of documents and validate them accordingly. STP enabled automation can play a huge role to manage the influx of documents that need to be digitized and stored. Irrespective of how your business quarter has been, STP can ensure the seamless functioning of the business.

### Operational Efficiency

Since there is no human intervention and STP enables complete automation, the overall operations of the organization become efficient and independent. As the data is automatically validated and stored on the cloud or on-prem, as the preference may be, any department of the organization can access the data easily. This does not disrupt the entire operational flow and ensures that the data, which was once unstructured and not well organized, is easily accessible across various departments due to STP.

### Improving Accuracy

STP, along with advanced OCR and IDP technology, ensures that the entire document automation process is error-free. Manual data entry may lead to various clerical errors while entering the data. Thanks to state-of-the-art data extraction and data validation solutions, documents are digitized accurately. All types of invoices, receipts and other documents can be accurately processed with the help of STP.

## Cost Reduction

Technology and automation can help businesses to reduce their cost due to economies of scale. The same applies to STP as well. More than a thousand documents can be automatically processed at a minimal cost. If manual labour is to be put in place, there would be a higher cost associated with it. STP provides end-to-end automated document processing and therefore, there is no additional or recurring cost associated with it.

## Faster Processing Time

Complete automation means you are bound to save time. STP can speed up the document processing time and make sure the data is extracted accurately. Manual processing of data is a very time-consuming process and as mentioned above, can cause errors as well. As documents are processed more quickly than compared to the manual data entry method, more documents can be processed in less time.

## Reputation Management

Goodwill is the most important intangible asset for any organization. Goodwill in the industry can be built through extraordinary services and timely payments for the goods or services purchased. STP will help to build a reputation for your organization in the industry as it will provide you with the advantage to automate your invoices and receipt processes. This means that payments will be made on time to the client without any errors.

## The Road Ahead

Straight Through Processing seems to be a promising way to add a layer of data validation to document automation processes. AI-driven technology has the ability to extract information from any type of document to reduce human intervention. Having said that, true automation cannot be achieved without highly accurate data extraction.

For data to be accurately captured, recognized and processed, the documents that are being scanned need to be clear. Documents that have faded or handwritten text, may not be processed at all. This is the reason why human intervention is required while processing documents.

Data extraction from electronic documents such as PDFs, email can be automated with more than 90% accuracy. Data in such types of documents is clear and therefore, the technology can capture and process data accurately. In such cases, true automation with data validation can be achieved through STP.

With the advancement in technologies, that day is not far wherein complete document automation will take place without any human intervention, even in cases of documents that are not electronically available.

## About KlearStack

KlearStack is an industry leader when it comes to document automation and extraction. Our aim is to provide template-free data extraction solutions to organizations to improve their business efficiency and structure unstructured data. Our AI-driven technology takes care of **end-to-end document automation** and extracts data with nearly **90% accuracy**.

Drop a line at [hello@klearstack.com](mailto:hello@klearstack.com) to get in touch with us.
